

5 small UI/UX things.

Lessons picked up in code reviews at Frappe. Each one is tiny. Together they make a big difference.

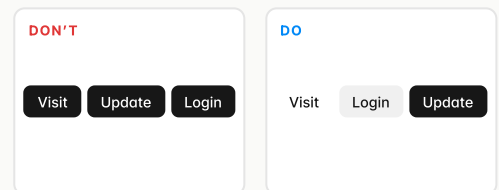

01 Don't disable the button. Tell them why.

A greyed-out action leaves people guessing. Keep it enabled, and on click say exactly what they need to do.

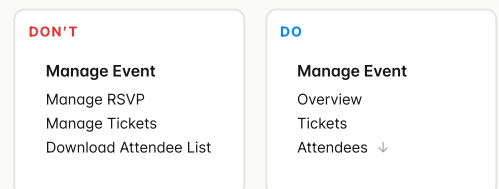

02 One primary action per view.

Ask what the person is here to do. That gets the primary button. Everything else is secondary or tertiary.

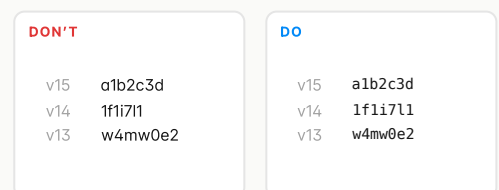

03 Cut redundant labels.

Proximity already gives the context. If you are inside "Manage Event", the tabs don't need to say "Manage" again.

04 Monospace for fixed-length strings.

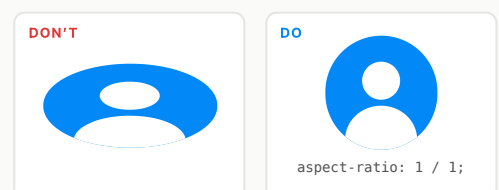

Commit hashes, IDs, codes: same number of characters, same width. The column lines up on its own.

05 Never break aspect ratios.

Lock proportions when you resize, and style images to survive any size a CMS throws at them.

"The biggest crime against humanity. — Rushabh"

Tricks like these aren't taught in college. We learn them by building in the wild and asking for feedback.
